Reason: Masculine & Feminine:

As I'm sure you're aware, our Mother's egg and Father's sperm made us what we are today.

It appears those 2 cells initially meet in another cell, that I presume represents each of us, individually.

So, our individual creation starts with 3 cells contained in a woman's womb, which technically makes 4 cells.

What wang-fangles my mind is the fact that both the sperm and egg carry so much information in such a small space or capacity, most of it relative to each parent's ancestral bloodlines.

This abundance of information carried by the sperm and egg consist of both masculine and feminine aspects; which is defined as nature's duality.

The egg cell tends to represent feminine qualities, the sperm cell masculine qualities, although each seem to acquire both in differing proportions.

The Tao symbol is a good representation of this.

We appear to be quite literally the embodiment of our ancestry.

I believe it's established that the most obvious pairing in nature is male and female, contained in the cell of nature, but is every man completely masculine and every female utterly feminine?

Mmmm.?!

Our physical appearance doesn't necessarily reveal all.

Some masculine traits include: physical strength; bravado; logical mind; competitive; decisive.

Some Feminine traits include: mental stamina; modesty; sensitive mind; camaraderie; open-minded.

To name but a few examples.

If nature's another word for balance then it’s worth considering our masculine and feminine traits distributed within us: trans-forming.

Energy, feelings and thought each have feminine and masculine aspects helping to make us the individuals we are.

I can see why someone who's born a physical (fe)male; can be dominated by feminine or masculine energy, feelings and thought; developing a gender imbalance and vice a versa.

Do masculine and feminine traits hold the answer to an ultimate natural balance?

Surely our will has feminine and masculine qualities as well as our hearts and heads.?!

Decipher the code.?!
