REASON:

Reason appears to offer us a meaningful foundation from which to start working ourselves out.

Ironically, no-one can escape from reason; not even unreasonable types.

Being reasonable seems to mean we have a balanced understanding of our self.

We're in control of our destiny, at least privately and hopefully personally. Before we have to consider the controlling aspects in the public domain; our society.

Reason is the ability to clearly state we know what we're doing; our justification.

What I like about reason is its desire for meaning; to know.

Being reasonable is proof we're not insane.

Do you have a;

REASON:
1. a motive, cause, or justification of something; a fact put forward as this, etc.
2. the ability to think and understand and draw conclusions.
3. sanity, etc.
4. good sense or judgement; what is right, practical, or possible; etc.

To help find some clarity and meaning, I've spliced reason into 3 parts; which I hope is reasonable.

Before I get into reason can we have a ganda at 2 very important factors that can't be overlooked and have a strong bearing on how reason appears to work.

I'm mentioning this because it becomes more pertinent as I breakdown reason's meaning.

The first word I've considered that describes our original source of being, contained in those tiny cells is;

CAPACITY:
1. the ability to contain or accommodate the amount that can be contained, etc.
2. ability, capability, etc.
3. a position or function, etc.

Capacity's a word that contains something in a space. Two cells multiplying or growing inside another cell, our origin, containing everything it needs to make a fully grown living being.

When we consider ourselves at any age we see our external capacity, yet within us there are many factors that all share a capacity for living.

Our individual capacity is living proof we're not all born equal.

Do you have the same capacity for food and drink compared to others around you?

Do you share the same capacity of patience or temper?

Our bodies are a capacity, are we all the same shape; with the same quality grade components, like our organs, etc.?

Our overall capacity acknowledges us as individuals; it's our society that's hell bent on herding us like cattle, generalising the populous instead of offering a personal service; which of course demands a much greater capacity of resources.

With regard reason, capacity is the source of what's being considered.

In order for anything to survive within its capacity needs an essential ingredient that has to stay on the pulse:

ENERGY:
1. the capacity for vigorous activity.
2. the ability of matter or radiation to do work either because of its motion (kinetic energy), or because of its mass (released in nuclear fission etc.) or because of its electric charge, etc.
3. fuel and other resources used for the operation of machinery, etc.

Energy get's the party started. Obviously, without energy life would be dead.

Humans aren't plugged into the mains; so how do we keep going, energetically?

When we consider the forces of nature like the sun and solar; water and hydro power; the wind turbines all able to produce natural energy; maybe that's what's powering us?

It's possible to capture energy with a plate of metal, day and night; the only phenomenon I'm aware of that has this capacity is known by lots of words worldwide; I know it as aether.

So, we call someone from our mobile and our chit-chat or signal is transmitted through the airwaves to a transmitter where it's directed to and fro both phones.

This means that something is carrying those signals or chit-chat through the airwaves; which implies there's energy in the air; known to some as aether.

If you go to Martin Liedtke's site, flat earth British, he can guide you through this incredible electrifying journey that's been kept from us.

You may have heard of free energy; I took this literally to begin with but usually when considering this it's all about the sum of what you put in taken away from what energy you get out; by using 100 Watts of energy you get 400 Watts out then that's 300 Watts of free energy.

There are some examples of this like solar, hydro and wind power but hideously, the prime example of free energy, that's been around for over 200 years is a gun.

What does that symbolise regarding those who run our society?

Like all things in life reason needs to be energised; to exist.

According to my interpretation of the Oxford Dic', capacity and energy = our WILL.

But where's the sense in that?

Perhaps, having the natural ability to;

FEEL:
1. to explore or perceive by touch.
2. to be conscious of, to be aware of being, etc.
3. to be affected by, etc.
4. to give a certain sensation or impression, etc. (of something).
5. to have a vague conviction or impression of something.
6. to have as an opinion, to consider, etc.

The word *to* or *too* combine the masculine and feminine qualities in the English lingo.

In definition No. 3: to be affected by; just in case your unaware of the difference between affect and effect; you know when a banger goes off at a firework display it can go straight through you? The effect of that banger on the outside world, affects our condition in our inside world.

To feel is akin to perception, which offers 5 senses to help us discover the outside world; all of them amounting to the sixth sense, intuition; a very feminine trait; connected to the heart.

Instinctive innate qualities are a kin to genetic ancestral hand-me-downs.

As I'm sure you're aware, these senses are received and transmitted by us, in and out of the airwaves in the hope of understanding their true nature; via interpretation.

It appears to me the one common denominator that joins all truth seekers at present, is their general sense that our worldwide establishment want to rid us of common sense.

When’s the last time you mentioned; *there’s no sense in that*.?!

Common sense can trigger feelings of mistrust, a lack of compassion, dodgy goings on. With this natural source of truth out of the way those in control can do anything.

Capacity + energy (=WILL) + feelings (=HEART) = Belief.

Until we can start putting labels to what we're sensing or believing it's intuitive, living on our guts approval.

Time to engage the brain:

THOUGHT:
1. the process or power of thinking.
2. a way of thinking which is characteristic of a particular class, nation, or period, etc.
3. meditation, etc.
4. an idea or chain of reasoning produced by thinking.
5. an intention, etc.
6. consideration, etc.

I liken thinking to interpretation; a font filled with labels associated to what we sense.

The brain does what a computer can do, probably a lot more if we were given the knowledge to explore its capacity.

In fairness it would be difficult and knackering to have to communicate using sense alone; thought brings the tools to be able to define what it is we're naturally feeling; before we have to consider society.

N.B. Thinking without incorporating the heart is a masculine trait.

Capacity + energy (WILL) + thought (HEAD) = mentality; associated with logic, legislation, AI, science, etc.

The OD experience states in the definition of logic *that science is the logic of reason*.

Stating that science isn't as fully formed as reason, but a part of it.

So reason can amount to;

Capacity + energy (WILL) + feelings (HEART) + thought (HEAD); each of these can be associated with masculine and feminine tendencies.

These elements can help to organise and define our reason for doing something.

If you haven't found enough meaning in your life, and aren't partial to religion, cults, clans or politics, consider deciphering reason; if you haven't already; it’s a neutral philosophical remedy.

Decipher the code.?!

C.Kin
